Multimodal Fake News & Image Tampering Diagnostic Report

Generated on 2026-08-02 01:05:55 IST | Project Forensic Audit
Analysis performed at 2026-08-02 01:04:48 IST

1. Executive Summary & Verdict

Final Classification Verdict	**REAL**
Overall Multimodal Risk Score	0.2730 (0.0=Real, 1.0=Fake)
Prediction Confidence	80.92%
Processing Time	1.25 seconds

This submission was classified as likely authentic, with high confidence (80.9%). The submitted image contributed most to this verdict (63% of the fused score), primarily because attribution to a credible source found: according to, statement. Additional supporting evidence: text model attribution flagged these tokens as most fake-indicative: organisation, research, research organisation.

2. Evidence Summary

• Attribution to a credible source found: according to, statement.
• Text model attribution flagged these tokens as most fake-indicative: organisation, research, research organisation.
• Error Level Analysis found no strong splicing/re-compression signal (anomaly score 0.063).
• Noise-inconsistency analysis found unusually uneven noise levels across the image, a pattern sometimes associated with compositing.
• No EXIF metadata was found in the image file.
• Simulated propagation graph shows a low proportion of suspicious/bot-like spreader accounts (7%).

3. Model Results & Fusion Weights

Modality	Model Engine	Risk Score	Weight	Relative Impact
Text Module	TF-IDF / BERT Transformer	0.0290	0.40	4.2%
Image Module	ResNet50 / ELA / pHash	0.4916	0.35	63.0%
Graph Module	PyG Graph Attention (GAT)	0.3574	0.25	32.7%

4. Analyzed Article Content

"The Indian Space Research Organisation (ISRO) has successfully completed another series of ground tests for its Reusable Launch Vehicle program. According to the official statement, engineers evaluated navigation systems, thermal protection components, and autonomous landing algorithms under simulated mission conditions. The collected data will support future experimental flight missions planned o..."

5. Text Explanation — Top Contributing Tokens

SHAP/coefficient attribution identified the following tokens as most influential in the text-model verdict: **organisation, research, research organisation, space research, official, official statement, statement, according**.

6. Image Explanation

Error Level Analysis showed no strong splicing signal (anomaly score 0.0633). Perceptual hash: `a0a0088828088000`. A GradCAM attention heatmap localizing the regions most influential to the ResNet-50 verdict was generated for this image (see dashboard for the visual overlay).

Forensic observations: no EXIF metadata was found (common after re-saving, screenshotting, or social-media re-upload, but also consistent with metadata having been deliberately stripped); noise levels vary unusually across regions of the image (coefficient of variation 0.74), a pattern sometimes associated with compositing content from a different source.

7. Propagation Analysis Summary

Simulated propagation graph: 45 nodes, 51 cascade edges, 9 detected communities, diffusion depth 4, 7% suspicious/bot-like accounts. Graph Attention Network propagation risk score: 0.3574.

8. Fusion Analysis

The final verdict is a weighted linear combination of the unimodal risk scores (see Section 3), calibrated via Platt scaling fit on the project's labeled demo corpus. Any modality not submitted for this analysis defaults to a neutral 0.5 score rather than being fabricated. The modality with the largest 'Relative Impact' in the table above contributed most to the final classification.

9. Final Decision & Recommendations

This content does not show strong indicators of fabrication based on the signals available to this system. As with any automated assessment, cross-verification against primary sources is still recommended before using this content for high-stakes decisions.
